Solution - Cloud based serverless microservices architecture

Design patterns

- parallelism
 - stateless nature allows for multiple independent serverless microservice instances to be run at the same time
- scatter/gather
 - divide the problem domain into smaller pieces that can be worked on in parallel, and gather them together when processing is complete
- loosely coupled
 - where possible, one microservice should not be waiting for another to finish
- event driven
 - the invocation of a service should be initiated by an event that is monitored or subscribed to
 - can be managed by a queue

Implementation using Amazon Web Services (AWS)

- serverless
 - Lambda
 - Fargate
- orchestration
 - Step Functions
 - parallelism, scatter/gather
 - Simple Queue Service (SQS), Simple Notification Service (SNS), Kinesis
 - loose coupling, event driven
- storage
 - Simple Storage Service (S3)
 - key/value store
 - Relational Database Service (RDS)
 - Aurora PostgreSQL databases with PostGIS extension
 - DynamoDB
 - serverless noSQL database

The diagram illustrates the AWS Cloud architecture for SkyWatch. It shows a user interacting with the system via an API endpoint (api.skywatch.co/earthcache/pipelines). The data flows through several services: Pipelines Service (Lambda), Pipelines Store (DynamoDB), Search Service (Lambda), Interval Service (Lambda), Pre Processing Service Scatter (Lambda), Satellite Data Processing Service Parallel (Lambda), Post Processing Service Gather (Lambda), Results Delivery (Lambda), Results Store (DynamoDB), Satellite Data Store (S3), Ingestion Service (Lambda), Queue (SQS), Arrival Notification (Lambda), and Results Service (Lambda). The entire workflow is orchestrated by AWS Step Functions. The diagram also shows a user interacting with the system via an API endpoint (api.skywatch.co/earthcache/pipelines/interval_results) and a Results Service (Lambda) that interacts with a Results Store (DynamoDB).

Advantages

- Scale when needed**
 - horizontal
 - run more instances
 - vertical
 - more memory, power for serverless instances
 - seamless db or other infrastructure upgrades
- Extend**
 - eg. SAR or Hyperspectral
 - easily add new or extend existing services
- Lower unit costs**
 - savings passed on to customers

Lessons learned

- app-wide standards - paved road
- coordination of deploys that require many services
- be judicious about technical debt and cleanup
